Problem D. Flowerpot S

Time limit 1000 ms **Mem limit** 131072 kB

Description

Farmer John has been having trouble making his plants grow, and needs your help to water them properly. You are given the locations of N raindrops ($1 \le N \le 100,000$) in the 2D plane, where y represents vertical height of the drop, and x represents its location over a 1D number line:

Each drop falls downward (towards the x axis) at a rate of 1 unit per second. You would like to place Farmer John's flowerpot of width W somewhere along the x axis so that the difference in time between the first raindrop to hit the flowerpot and the last raindrop to hit the flowerpot is at least some amount D (so that the flowers in the pot receive plenty of water). A drop of water that lands just on the edge of the flowerpot counts as hitting the flowerpot.

Given the value of D and the locations of the N raindrops, please compute the minimum possible value of W.

老板需要你帮忙浇花。给出 N 滴水的坐标,y 表示水滴的高度,x 表示它下落到 x 轴的位置。

每滴水以每秒1个单位长度的速度下落。你需要把花盆放在x轴上的某个位置,使得从被花盆接着的第1滴水开始,到被花盆接着的最后1滴水结束,之间的时间差至少为D。

我们认为,只要水滴落到 x 轴上,与花盆的边沿对齐,就认为被接住。给出 N 滴水的坐标和 D 的大小,请算出最小的花盆的宽度 W。

Input

第一行2个整数N和D。

接下来 N 行每行 2 个整数,表示水滴的坐标 (x,y)。

Output

仅一行1个整数,表示最小的花盆的宽度。如果无法构造出足够宽的花盆,使得在D单位的时间接住满足要求的水滴,则输出-1。

Sample 1

Input	Output
4 5 6 3 2 4 4 10 12 15	2

Hint

有 4 滴水,(6,3),(2,4),(4,10),(12,15)。水滴必须用至少 5 秒时间落入花盆。花盆的宽度为 2 是必须且足够的。把花盆放在 $x=4\dots 6$ 的位置,它可以接到 1 和 3 水滴,之间的时间差为 10-3=7 满足条件。

【数据范围】

40% 的数据: $1 \le N \le 1000$, $1 \le D \le 2000$ 。

100% 的数据: $1 \leq N \leq 10^5$, $1 \leq D \leq 10^6$, $0 \leq x,y \leq 10^6$ 。
